

Communities need to recycle

Communities need to recycle. Recycling is where something is used again or made into new products. This exposition will prove that we **MUST** recycle at home, school and in our environment.

Firstly, communities must recycle because billions of tonnes of rubbish is going to landfill. Each Australian produces 400kg of rubbish each year. This means that the billions of tonnes of waste will go into our environment because there will be no more space for landfill.

Another reason why we need to recycle is because making new products uses energy. Energy, like electricity, makes pollution. That means there will be a large amount of pollution in our community. If we recycle there will be less pollution in our water, air and food.

Finally, it is essential for communities to recycle because we **CAN** recycle over half of our waste. We can recycle aluminium, food scraps, some plastics and paper. If we recycle more there will be less pollution in our environment and we can make a lot of helpful products.

In conclusion, this exposition has proved that communities must recycle. It stops rubbish going to landfill, it reduces energy waste and we get new products. Don't you want to help the community recycle?
